

Recent Client Survey Results Showcases iSchematic's Return On Investment Potential.

IntelliSchematic announces a high ROI for clients using their iSchematic tool.

Buffalo Grove, Illinois – December 31, 2013 – After surveying several clients, IntelliSchematic has been able to highlight specific areas where iSchematic has dramatically improved maintenance procedures. The critique focused on unscheduled downtime and operating gains to determine the overall benefit to an organization.

Unscheduled downtime is the most reliable indicator for determining iSchematic's success. In the majority of instances, clients reported impressive reductions in downtime periods shortly after implementation. Clients saw a 53 percent decrease, on average, in machine downtime – with one client being able to cut its downtime by two-thirds.

"We can attribute iSchematic's rapid acceptance to its ability to turn static machine documents into living applications that supply technicians with customized tools and data," said Andrew Kauser, President Telemedia, Inc. "Once we received the performance results from several of our clients, we were able to truly understand the ROI they were seeing after adopting our troubleshooting tool."

The other ROI component surveyed, operating gains, revealed that clients saw similar increases in efficiency. IntelliSchematic produced these results by providing maintenance technicians with custom troubleshooting documentation and component information. This information helped pinpoint problems and components with failure symptoms. By identifying problems and failure symptoms faster, clients reported sharp improvements in the following areas:

- Decline of total hours lost to machine downtime
- Higher overall operating efficiency
- Reduction in overall sales revenue lost by outages
